

GitOps Workflow on AWS EKS (ArgoCD + CI/CD)

How It Works (Flow)

- Developer commits code or updates K8s YAML
- Code is pushed to GitHub (Repository)
- ArgoCD detects changes and Syncs from Git (Pulls Manifests)
- ArgoCD applies changes to EKS (Desired State)
- EKS pulls Docker images from Amazon ECR
- Ingress + ALB exposes app via domain (xyz.com)
- HPA scales pods automatically
- Monitoring via Prometheus & Grafana (grafana.xyz.com)
- SSL is managed automatically by cert-manager (Let's Encrypt)
- ArgoCD ensures self-healing and keeps cluster in sync
